To Whom It May Concern:

We have been asked to comment on the product "Z.R.C." as manufactured by Z.R.C. Worldwide of Marshfield, Massachusetts. This gives us pleasure because we have been intimately knowledgeable of the performance and reputation of this product for twenty-five years, and regard it as one of the more successful coatings in the genre. Comparative evaluations of the performance of the product performed in our laboratory against many other organic zinc rich primers from all parts of the world have well illustrated the excellence of Z.R.C.. The product enjoys diverse markets across the world and is viewed almost universally with favor. We have yet to hear of any unfavorable experience in the field.

Z.R.C. is a time proven and effective organic zinc rich metal primer, successfully employed as both an anticorrosive primer for steel and a device for the repair of galvanized zinc surfaces. Unlike many galvanized steel primers, Z.R.C. is a fully effective sacrificial primer and will provide long-term protection to uncoated steel as well as zinc surfaces. It does this via a combination of zinc dust and a proprietary organic binder, which is uniquely user friendly, and which will tolerate application over marginal surfaces. Zinc anode loadings (at 94% by weight of the film) are well in excess of most coatings of this type and ensure anode availability and the maintenance of protective current flow under aggressive atmospheric service conditions for many years. As the film ages under normal atmospheric exposure, the protective activity advances from cathodic to barrier protection, by virtue of a secondary growth of inorganic zinc corrosion product which blocks the interstitial porosities of the aging film, increasing permeability and resistance to solvents.

It gives us great pleasure to endorse the product, and we stand ready to discuss this endorsement with all interested parties.

Yours truly,

Clive H. Hare, Inc.

Clive H. Hare,  
President.
